STANDARD OPERATING PROCEDURE · BY ROLE

Supervisor

For: Supervisor · Full Harvest Inventory

This procedure is for the senior supervisor whose login does everything except open **Settings**: run the floor, read the numbers, approve adjustments, run the cycle program, the front-bin moves and the Not in Location list. It is a map of the three procedures that make it up, with what is specific to holding all of them at once. Read it with:

- **SOP — Count Supervisor** for count day on the floor;
- **SOP — Inventory Control** for the numbers, the approvals and the exports;
- **SOP — Warehouse Jobs** for front bins, moves, Not in Location and the cycle program.

5 — Between counts 7

6 — Where everything is 8

1 — What this login can and cannot do

Can: everything on the Dashboard (progress, map, team plan, alerts, second counts, adjustments, reports), Teams & crew (crew, teams, equipment rules, the counting plan), Cycle counts, Front bins and the move desk, Not in Location, the Testing Suite, every download, every approval, messages and SOS, raising second counts, the board note.

Cannot: anything under **Settings**. That is: create or close a count, change its options and thresholds, upload the bin list or the inventory report, pair racking blocks, register or reset scanners, choose which jobs the guns offer, the ERP file, backups, logins, the site name, the Teams channel. An admin does those; section 2 is the list to hand them.

2 — Before a count: what to ask the admin for

Hand the admin this list a day ahead, filled in:

ASK	WHERE THE ADMIN DOES IT
Ready for count day has no red lines (the admin's check of the site)	Settings → Count setup
Create the count, name it, make it the scanners' default	Settings → Count setup → Count session
Upload the bin list; pair the racking blocks	Settings → Lists & racking
Upload each system's inventory report, naming the system	Settings → Lists & racking → Inventory report
Thresholds: Recount over __ units / __ %, cap __; approvals on/off, threshold __	Count session options
Pallet check: off / warn / strict; guided bins on; the map drawing	Count session options
Scanners registered, links opened, app installed, charged	Settings → Scanners
Jobs on the scanners: full count only for count day	Settings → Scanners → Jobs on the scanners
A trial run, if the crew is new; End the trial before the real start	Count session → Trial run
Teams channel test card sent	Settings → Integrations

Then build the **counting plan** yourself (Teams & crew): teams, crew, aisles in order, **Stagger**. Check the guided setup card with the admin until nothing is red.

3 — Count day, in one page

1. **Start of shift**: teams sign on (count, team number, every clock-in number, *Sign on & load list*); Team plan fills; the board on the TV.
2. **Watch**: Progress for pace, Map for coverage, Team plan for who has stopped, Alerts for SOS, Reports → Fix list for labels, damage and blocked bins. Walk the fix list while the team is nearby.
3. **Answer**: an SOS gets **Seen** first, then feet; a stopped-scanning alert gets a message first, then feet; messages carry instructions, not questions.
4. **Second counts**: keep the list moving while teams are on the floor; if it is hundreds deep after one aisle, the thresholds are wrong and the admin changes them now.
5. **Hand-back**: every aisle handed back, every bin counted or its absence written down, nothing open on second counts, the fix list walked, every gun signed off and on charge.
6. **The numbers**: pallet report status by status and by system, adjustments approved with reasons, the close-out checklist in the Inventory Control procedure. Tell the admin to **close**; after the close the MISSING pallets join the adjustments; approve or reject them; sit with the admin for the ERP file; export everything and the log.

4 — Wearing two hats: floor and numbers

Small sites give one person both. What to keep separate:

- **Do not approve adjustments while teams are still in those aisles.** A second count that changes a pallet clears its approval and the line comes back. Approvals are an afternoon job, after the floor is quiet.
- **Do not raise second counts on your own aisle's variances and then count them with the same team.** The gun prefers a different team for a second count; let it.
- **The log keeps the two apart for you**: it records who raised, who counted, who approved. An auditor reading it should see the same name only where there was nobody else.
- **A trial run is the time to rehearse the whole day** in two hours: sign on, count, SOS, second counts, approvals, the file. End the trial, then start for real.

5 — Between counts

- **Cycle counts**: today's batch, what is still open, coverage; counters sign on with a badge alone. One session for the year.
- **Front bins**: the front-placed list after a count, the move list built from it, the move desk (and the gun's Front2Back, with the pallet system framed on both).
- **Not in Location**: the ERP's lost pallets; any scan anywhere finds them; close the rest.
- **Teams & crew**: leavers off the crew, new badges on, equipment rules current.
- **Testing Suite**: twenty minutes with every new starter, and with everyone before a wall-to-wall. *What to practice* sets up the cycle count, a move and a Not in Location run.

6 — Where everything is

I WANT TO…	GO TO
see every full count, open and closed, and which one the scanners land on	Full Counts
see how the count is going	Dashboard → Progress, Map
see where a team is, move an aisle, message a team	Dashboard → Team plan
answer an SOS, quiet a stopped-scanning alert	Dashboard → Alerts
send a bin back for a recount	Dashboard → Second counts → Request second count
read what differs from the report	Dashboard → Reports → Pallet report, Hide matching pallets
find every case of a lot	Dashboard → Reports → Find a lot
see labels to replace, damage, blocked bins	Dashboard → Reports → Fix list
sign off differences	Dashboard → Adjustments
download the whole count	Dashboard → Reports → Export everything
add a counter or a team, build the plan	Teams & crew
run today's cycle batch	Cycle counts → Today
move front pallets back	Front bins → Pallets to move back, Move desk
find a pallet the ERP lost	Not in Location
try something on a gun without touching a real count	Testing Suite
find a pallet, a bin, a setting, a card	the search box at the top of the sidebar, **/**
understand a message	User guide → Ask the guide
anything under Settings	an admin
