STANDARD OPERATING PROCEDURE · BY ROLE

Your first full count how it works

For: Count supervisors, inventory control and counters new to the app · Full Harvest Inventory

This guide is for someone who has never used the app. It walks through a full count (a wall-to-wall) from your first sign-in to the last adjustment, for the people who run it and the people who count. An admin sets the site up first: the scanners, the count itself and its lists. Where you need something from Settings, this guide says to ask an admin.

Printed October 27, 2026

12 — Reports, adjustments and the ERP 15

13 — When something is not right 16

1 — What the app does

For each count the app holds **every bin in the warehouse** and **what the ERP thinks is on each pallet**. Counters walk the aisles with Zebra scanners and scan each pallet, its quantity and its bin. The app compares the count with the ERP's numbers, sends a different team back to look again where they disagree, and lists the adjustments for the ERP.

Words you will meet.

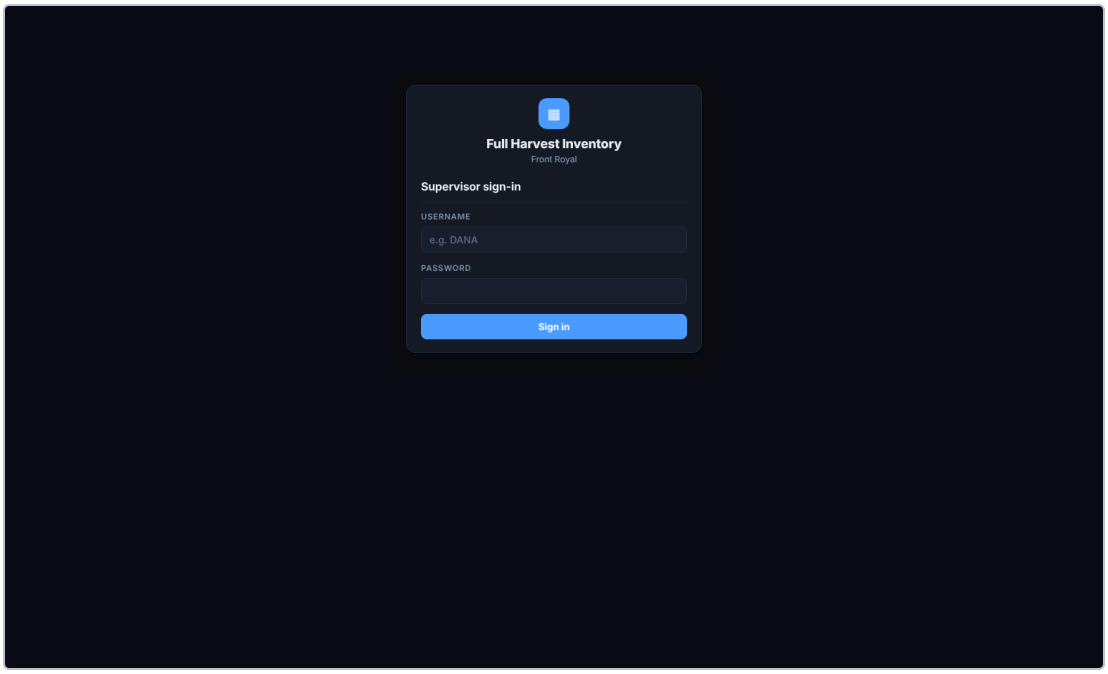

- **Bin** — one location on the racking. `F01A001` is zone **F**, aisle **01**, level **A**, position **001**.
- **Aisle** — one rack run, such as `F01`. Teams are given whole aisles.
- **Racking block** — aisles that back onto each other. Only one team works a block at a time.
- **Second count** — a bin another team counts again, because the first count disagreed with the ERP.
- **Adjustment** — a difference that will change the ERP's stock.

2 — Your first sign-in

An admin makes your login and sends you one of two things.

- **An invite link.** Open it, choose a password, and you are signed in. It works once, for three days. Ask for a new one if it has run out.
- **A starter password**, such as `winter-4k2p`. Sign in with your username and it, then choose your own password when asked.

After that, sign in at the site's address with your username and password. One sign-in covers every office page in that browser.

Five wrong passwords lock your login out from that computer for 15 minutes. Wait, or ask an admin to unlock it. **Change my password** at the foot of the side panel changes yours any time.

Counters do not need a login. They sign on at the scanner with a team number and their clock-in number.

3 — Find your way around

The side panel on the left lists the pages your login may open.

PAGE	WHAT IT IS FOR
Dashboard	The live view of the count: progress, teams, aisles, alerts, the team plan
Full Counts	Every wall-to-wall, how far each got, and which one the scanners land on
Inventory Control	Second counts, adjustments and reports
Teams & crew	The crew list and the teams
User guide	This guide and the others, and *Ask the guide* for questions in your own words

The count picker. The box at the top of every page says which count you are looking at. Check it before you change anything.

More room. The round **«** on the side panel's right edge hides it. Put the mouse on the thin strip at the left edge to slide it back.

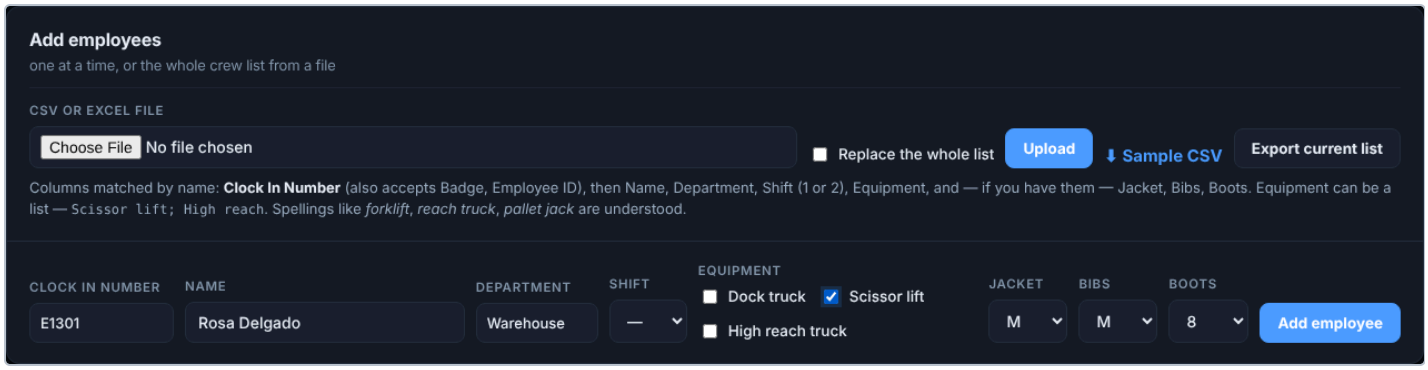

On a phone. Open the site in the phone's browser, sign in, and choose **Add to Home Screen**. It then opens like an app.

4 — The crew list

Teams & crew → Employees. Everyone who counts must be on it. A scanner refuses a clock-in number that is not.

1. Press **Add employees**.
2. Type the **clock-in number** and **name**. Pick the **shift** and **equipment** if you know them.
3. Press **Add employee**. The form clears for the next person.

Edit on a row changes someone. **Remove** takes them off. A whole list can be uploaded from a CSV or Excel file, with one row per person and a *Clock in number* column.

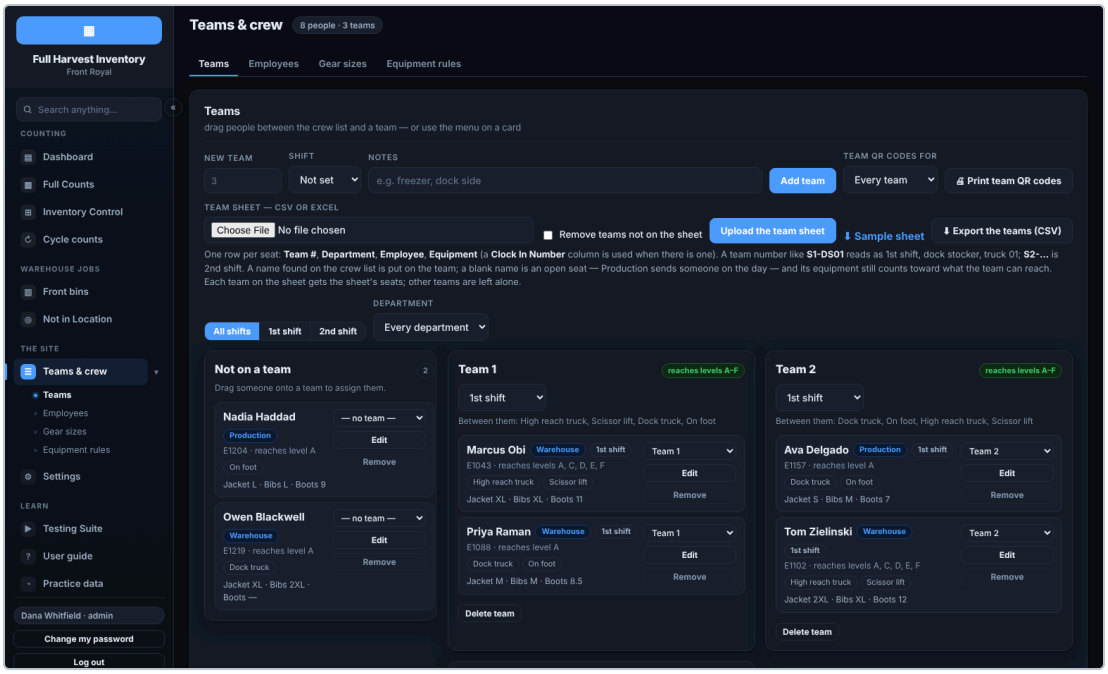

5 — Teams and their QR cards

Teams & crew → Teams. A team is the crew on one scanner.

- **Add team** makes one: its number (such as `S1-DS01`), its shift and a note.
- **Drag** a person from *Not on a team* onto a team's card.
- **Upload the team sheet** builds every team at once, from a sheet with *Team #, Department, Employee, Equipment*. *S1-DS01* reads as 1st shift, dock stocker, truck 01.
- **1st shift / 2nd shift** above the board shows one shift at a time.

The equipment matters. A team is only sent to the levels its equipment reaches, so a crew on foot is never given level D.

🖨 **Print team QR codes** prints a card per team with its number as a QR code. Pick a shift in the box beside it first. Give each team its card: at sign-on they scan it instead of typing the number.

6 — Give the teams their aisles

Dashboard → Team plan. A board: the aisles nobody has planned on the left, a column per team on the right with its aisles in counting order — **Counting now** with a progress bar, **Next**, **Queued**, **Held** while another team has that racking, **Done**.

The easy way: under **Auto-assign the aisles**, pick the teams (blank is every team), press **Preview**, read the warnings, and press **Queue this plan**. Each team gets its own stretch of the building and only the levels it can reach.

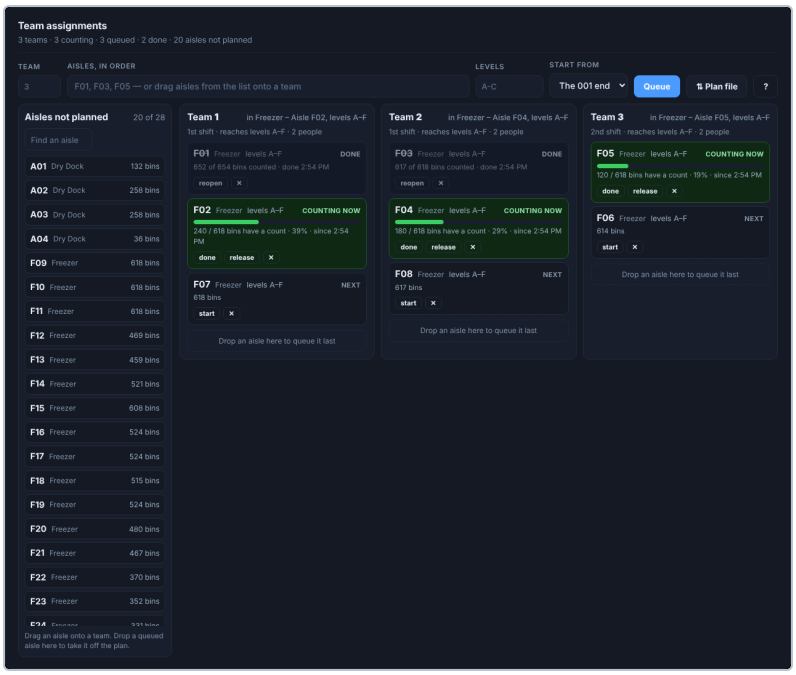

By dragging: drag an aisle from the list onto a team; it is queued with the levels the team reaches. Drag a queued aisle up or down to reorder it, onto another team to move it, or back onto the list to take it off the plan.

By hand: Queue aisles for this team on an empty team, or the row above the board: team, aisles in order, levels, then **Queue**.

From a file: ⇅ Plan file, then **⬇ Sample plan** for the layout. Fill it in and press **Upload a plan**.

On each aisle, **done** finishes it, **release** sends it to the back of the queue, and ✕ takes it off the plan. A team's next aisle starts by itself when its block is free.

Finishing an aisle is yours, not the scanner's. The scanner has no "aisle complete" button. When a team says its aisle is done, press **done** on that aisle here: that raises the second counts for pallets nobody saw, files the aisle, and the team's next aisle shows on its scanner.

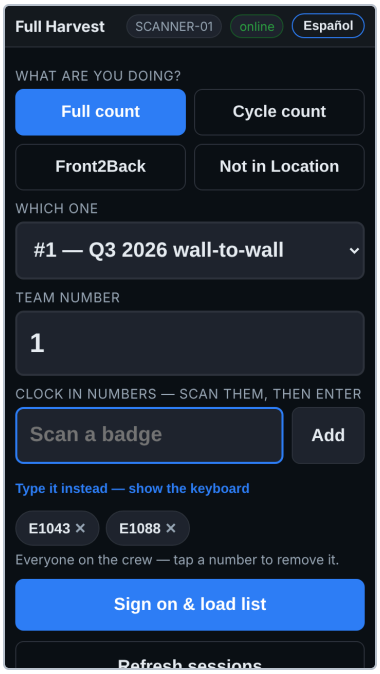

7 — Practice before the day

Testing Suite in the side panel has the real scanner app on screen, with practice bins and pallets. Nothing there touches a real count. Count a few pallets, an empty bin, and a pallet not on the list, so the buttons are familiar before count day.

The training film `docs/training/scanner-training-full-en.mp4` (in Spanish, `-es.mp4`) shows a counter's whole routine on a real scanner, slowly, in under ten minutes. The slides beside it are the same lesson. For cycle counts there is `scanner-training-cycle-en.mp4` (and `-es.mp4`).

8 — On the scanner: signing on

1. Open the app from the scanner's home screen. It lands on today's count.
2. Scan the team's QR card into **Team number**, or type the number.
3. Scan or type every **clock-in number** on the crew, pressing Enter after each. Tap a number to remove it.
4. Press **Sign on & load list**. The scanner downloads what it needs and keeps working with no signal.

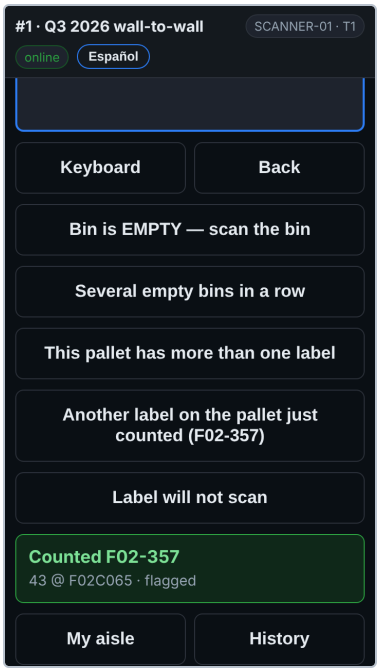

The next screen shows the team's aisle and what is queued after it.

9 — On the scanner: counting

One pallet (bin first)

1. **Scan BIN LOCATION.** The yellow rack label under the pallet. The scanner says where that bin is.
2. **Scan PALLET ID.** The scanner names the pallet but not what is on it. Count what is in front of you.
3. **Enter QUANTITY.** A big number may need typing twice.
4. **Comments.** Tap a reason if one fits, or leave it and it moves on by itself.

The line is saved on the scanner at once and sent whenever there is signal. **Next bin** at the top says which bin is next.

The buttons

BUTTON	WHEN
Bin is EMPTY	Nothing in the bin
Nothing more here →	The scanner expects more pallets in the bin, and there are none
This pallet has more than one label	One pallet, two or more labels with their own quantities. Scan the bin once, then each label and its quantity, then **Done**
Another label on the pallet just counted	You spotted the second label after the line was saved

BUTTON	WHEN
Label will not scan	Type what is printed, or count it without a label
Back	Wrong entry: go back one question
Keyboard	Type something by hand
History	Your team's lines in the last 20 bins. **Void** removes a wrong one and sends you back to that bin
Report a problem	Damage, or a bin blocked by a truck
SOS — I need help	An emergency. The office sees the team, the aisle and the last bin
Start second counts	When the scanner says bins are waiting to be counted again

When the scanner asks a question. A pallet not on the ERP's list asks **Count it anyway?** Say **YES** to count it, or **NO** if it was the wrong barcode. A bin outside your aisle, or a pallet already counted, asks why: pick a reason and press **Accept and continue**, or **Cancel — rescan**.

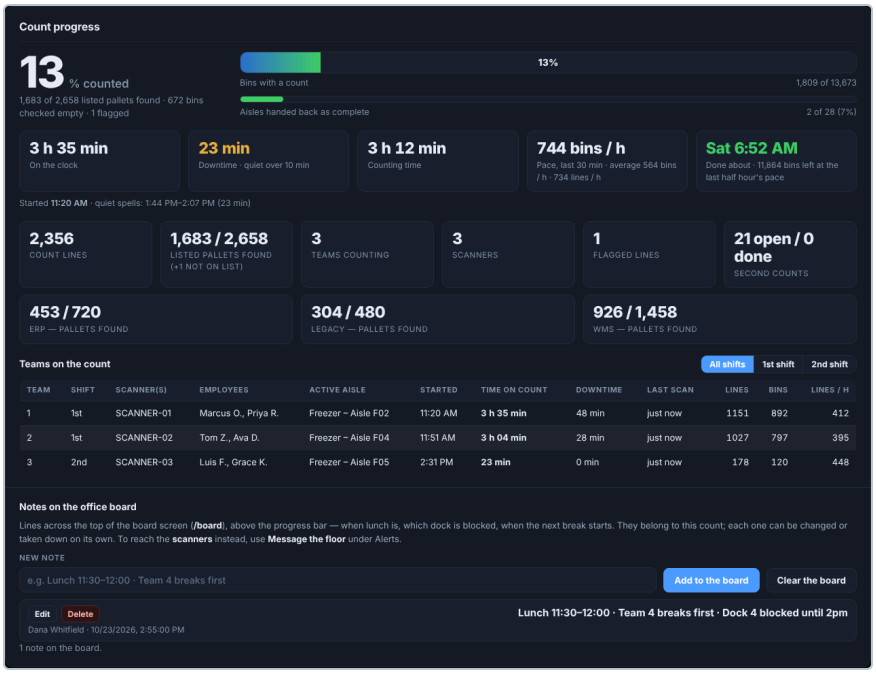

OFFLINE at the top means no signal. Keep counting. The lines wait on the scanner and send by themselves.

English or Spanish: the button at the top right switches the scanner's language.

10 — Running the floor

Dashboard, with the count in the picker. It refreshes itself every 30 seconds.

- **Progress** — bins counted, lines and exceptions, then a row per team: who is on its scanner (first name and last initial), what it is counting, its clock, its last scan and its pace.
- **An amber bar** — a team has stopped scanning. **On break** or **Lunch** quiets it. **Seen — I am on it** quiets it until the team scans again.
- **A red bar with a chime** — an SOS. Press **I am on it**, and the counter's scanner says help is coming. Then go.
- **Message the floor** — a line on one team's scanners or everyone's. The table shows who has read it.

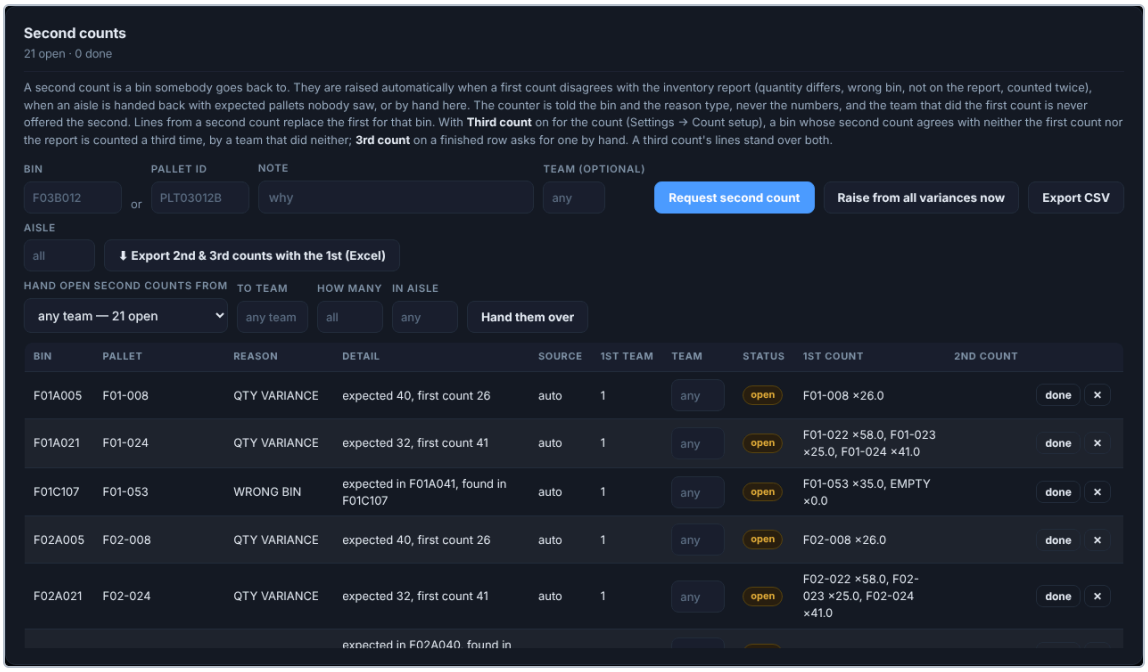

Watch for one team with climbing exceptions (often a training problem), a team stopped for a long time, and an aisle nobody has started by mid-afternoon.

The **crew board** at `/crew` shows the teams and who is on them by shift, with where each is counting, for a screen by the time clock.

11 — Second counts

Inventory Control → Second counts. When a count disagrees with the ERP by more than the site's limits, the bin goes on this list for a different team to count again.

1. **Raise from all variances now** adds everything that disagrees so far. Aisles nobody has reached are left alone.
2. On the scanner, a team taps **Start second counts** and counts the bin again without seeing the first count. Once every pallet expected there is counted the gun moves on by itself; **Bin done — nothing more here** is for a bin with fewer.
3. The second count replaces the first:
   - **it agrees with the first count** — the difference is real;
   - **it agrees with the ERP** — the first count was wrong;
   - **it agrees with neither** — a third team may be sent, and its count stands.

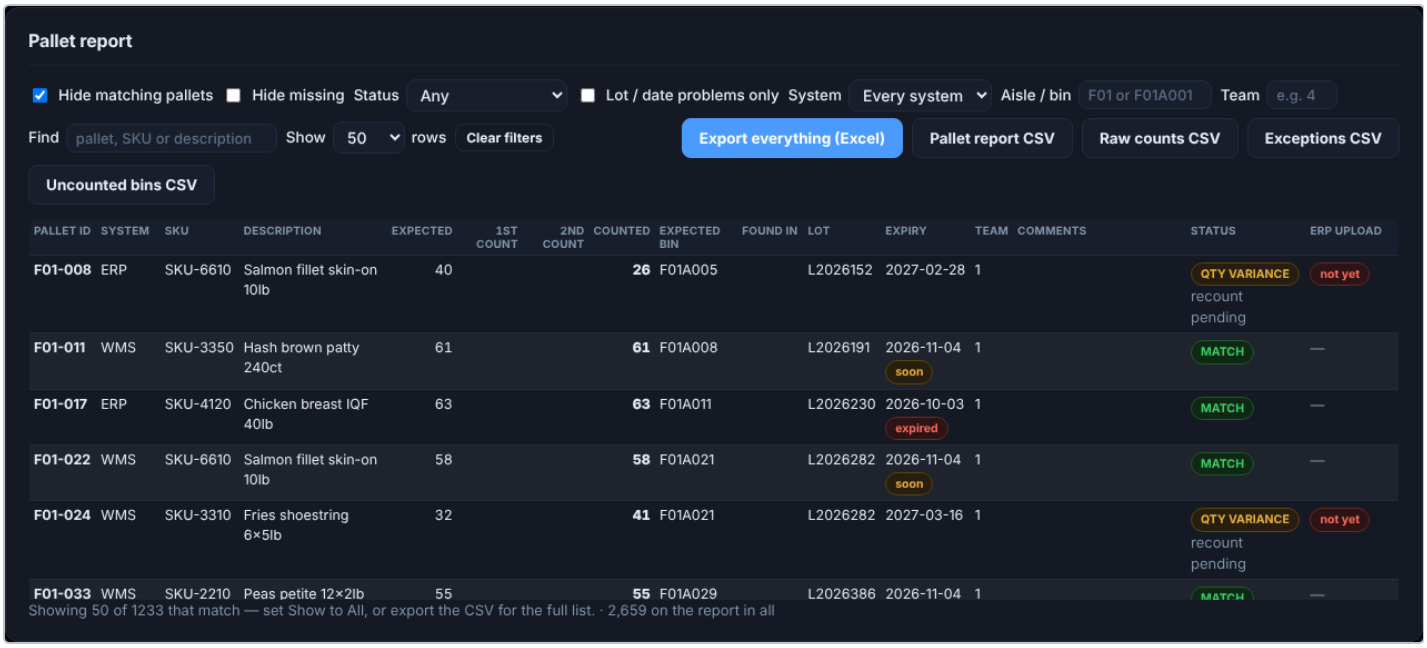

Work the list down to none open before the count is closed.

12 — Reports, adjustments and the ERP

Inventory Control → Reports.

- **Pallet report** — a row per pallet: expected, the 1st and 2nd counts, what stands, where it was found, the team and the status (`MATCH`, `QTY VARIANCE`, `WRONG BIN`, `MISSING`, `NOT IN MASTER`, `COUNTED TWICE`). **Hide matching pallets** leaves the list to work down.
- **Fix list** — labels to replace, damage and blocked bins. Once a label is printed and on the pallet, press **Label printed & on the pallet** on its row and it leaves the list.
- **Export everything (Excel)** — every table for the count in one workbook.

Inventory Control → Adjustments. *Positive and negative* shows the stock to add and to take off. Where the count needs approval, tick the lines you are satisfied with, pick a **reason**, and press **Approve selected**. Nothing unsigned goes to the ERP.

Into the ERP, an aisle at a time. Under **ERP upload, an aisle at a time**, wait until an aisle has no second counts open, press **⬇ Excel**, key its lines into the ERP, write *yes* in **Uploaded to ERP** for each one, and bring the sheet back with **⬆ Upload a filled-in sheet…**. Only that column is read back, so a quantity changed in the sheet by mistake changes nothing.

The guides **Reports and exports** and **The ERP upload, an aisle at a time** go through these in full.

13 — When something is not right

WHAT YOU SEE	WHAT TO DO
Scanner: *…is not on the crew list — see a supervisor*	Add the person under Teams & crew → Employees, then they sign on again
The scanner offers no count	Ask an admin to put the count on the scanners
The scanner says **OFFLINE**	Keep counting. Lines send by themselves when signal comes back
A scan does nothing	Check the cursor is in the box, then ask an admin to check the scanner's setup
A team is not given an aisle	Its equipment may not reach those levels, or another team is in that racking block
A wrong line was counted	**History** on that scanner, then **Void**
You cannot open a page or press a button	Your login does not include it. Ask an admin

For anything else, type the question or paste the message into **User guide → Ask the guide**.
